

Compute-model sensitivity of the C3 INC result (2-layer/seq-128 anchor, TP4/DP2/PP2, 16 ranks, two-tier pcm)  
re-measured 2026-07-15, pcm-sdk (run-only), -intranode\_linkspeed 4000000 (NIC pinned to the pipes' realised rate)

x19.6 more compute -> +11.8% baseline makespan;  
INC < baseline under H100 only -- placebo flips negative

The compute model now flips the SIGN of the gain:  
-4.65% (placebo) -> +8.81% (H100), shift +13.46 pp
